1. Overview

The XT26Q01D is a 1G-bit (128M-byte) SPI (Serial Peripheral Interface) NAND Flash memory, with advanced write protection mechanisms. The XT26Q01D supports the standard Serial Peripheral Interface (SPI), Dual/Quad I/O option.

2. Features

1G-bit NAND Flash memory
- Single-level cell (SLC) technology
- Page size : 2176 bytes(2048 + 128 bytes)
- Block size : 64 pages(128K + 8K bytes)
- Device size: 1Gb(1024 blocks)

Serial Interface
- Standard SPI: CLK, CS#, SI, SO, WP#
- Dual SPI: CLK, CS#, SIO0, SIO1, WP#
- Quad SPI: CLK, CS#, SIO0, SIO1, SIO2, SIO3

High Performance
- 108MHz for fast read
- Quad I/O data transfer up to 432Mbits/s
- 2K-Byte cache for fast random read

Advanced Security Features
- Write protect all/portion of memory via software
- Lockable 8K-Byte OTP region
- 128-Bit Unique ID for each device

Program/Erase/Read Speed
- Page Program time : 360us typical
- Block Erase time : 4ms typical
- Page Read time : 140us typical (with ECC)

Single Supply Voltage: 1.7V~1.95V

Advanced Security Features
- 8bit ECC option, per 528 bytes
- Internal data move by page with ECC
- Promised golden block0

Package
- 8-pin WSON (8*6mm)
- All Packages are RoHS Compliant and Halogen-free

Data retention: 10 years

3. Packaging Type and Pin Configurations

XT26Q01D is offered in an 8-pin WSON 8x6 mm^2 as shown below. Package diagram and dimension are illustrated at the end of this datasheet.

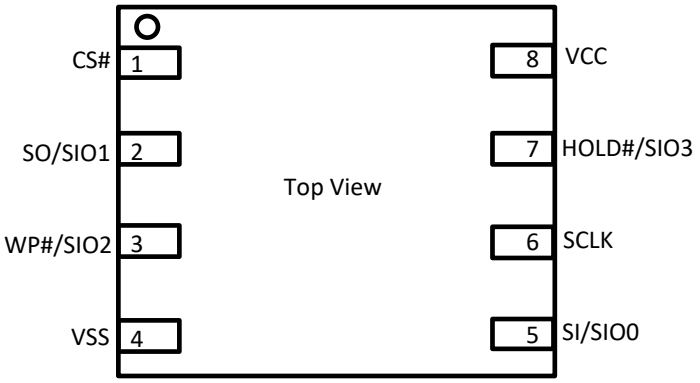

Figure1. Connection Diagram

Pin Description

PIN NO.	PIN NAME	I/O	FUNCTION
1	CS#	I	Chip Select Input
2	SO (SIO_1)	I/O	Data Output (Data Input Output 1) (1)(2)
3	WP# (SIO_2)	I/O	Write Protect Input (Data Input Output 2)(2)
4	VSS		Ground
5	SI (SIO_0)	I/O	Data Input (Data Input Output 0)(1)(2)
6	CLK	I	Serial Clock Input
7	HOLD# (SIO_3)	I/O	Hold Input (Data Input Output 3)(2)
8	VCC		Power Supply

Notes:

1. SIO0 and SIO1 are used for Dual SPI instructions.
2. SIO0 – SIO3 are used for Quad SPI instructions

5. Memory Mapping

Note:

1. **CA**: Column Address. The 12-bit column address is capable of addressing from 0 to 4095 bytes; however,only bytes 0 through 2175 are valid. Bytes 2176 through 4095 of each page are “out of bounds, ” do not exists in the device, and cannot be addressed.
2. **RA**: Row Address. RA<5:0> selects a page inside a block, and RA<15:6> selects a block.

7. Device Operation

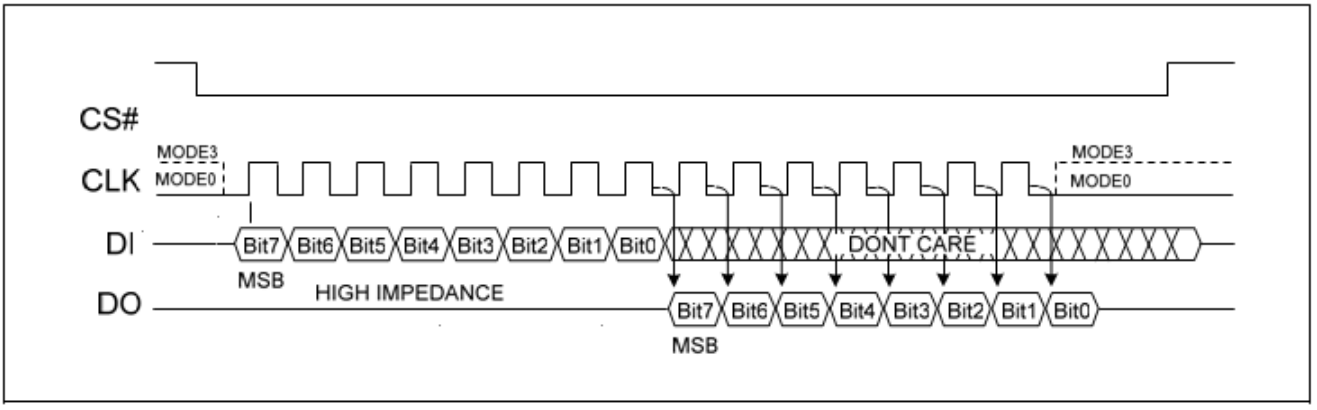

7.1 SPI Modes

7.1.1 Standard SPI

The device is accessed through an SPI compatible bus consisting of four signals: Serial Clock (CLK), Chip Select (CS#), Serial Data Input (SI) and Serial Data Output (SO). Standard SPI instructions use the SI input pin to serially write instructions, addresses or data to the device on the rising edge of CLK. The SO output pin is used to read data or status from the device on the falling edge of CLK.

SPI bus operation Mode 0 (0,0) and 3 (1,1) are supported. The primary difference between Mode 0 and Mode 3 concerns the normal state of the CLK signal when the SPI bus master is in standby and data is not being transferred to the Serial Flash. For Mode 0, the CLK signal is normally low on the falling and rising edges of CS#. For Mode 3, the CLK signal is normally high on the falling and rising edges of CS#.

Figure4. SPI SDR Modes Supported

7.1.2 Dual SPI

The device supports Dual SPI operation when using the x2 and dual IO instructions. These instructions allow data to be transferred to or from the device at two times the rate of ordinary Serial Flash devices. When using Dual SPI instructions, the SI and SO pins become bidirectional I/O pins: SIO0 and SIO1.

7.1.3 Quad SPI

The device supports Quad SPI operation when using the x4 and Quad IO instructions. These instructions allow data to be transferred to or from the device four times the rate of ordinary Serial Flash. When using Quad SPI instructions the SI and SO pins become bidirectional SIO0 and SIO1 and the WP # and HOLD# pins become SIO2 and SIO3 respectively. Quad SPI instructions require the Quad Enable bit (QE) to be set.

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.2 Pin Description

7.2.1 CS#

The SPI Chip Select (CS#) pin enables and disables device operation. When CS# is high, the device is deselected and the Serial Data Output (SIO0, SIO1, SIO2, SIO3) pins are at high impedance. When deselected, the devices power consumption will be at standby levels unless an internal erase, program or write status register cycle is in progress. When CS# is brought low, the device will be selected, power consumption will increase to active levels and instructions can be written to and data read from the device. After power-up, CS# must transition from high to low before a new instruction will be accepted.

7.2.2 CLK

This input signal provides the synchronization reference for the SPI interface. Instructions, addresses, or data input are latched on the rising edge of the CLK signal. Data output changes after the falling edge of CLK.

7.2.3 Serial Input (SI) / SIO0

This input signal is used to transfer data serially into the device. It receives instructions, addresses, and data to be programmed. Values are latched on the rising edge of serial CLK clock signal.

SI becomes SIO0 – an input and output during Dual and Quad commands for receiving instructions, addresses, and data to be programmed (values latched on rising edge of serial CLK clock signal) as well as shifting out data (on the falling edge of CLK).

7.2.4 Serial Output (SO) / SIO1

This output signal is used to transfer data serially out of the device. Data is shifted out on the falling edge of the serial CLK clock signal.

SO becomes SIO1 -an input and output during Dual and Quad commands for receiving addresses, and data to be programmed (values latched on rising edge of serial CLK clock Signal) as well as shifting out data (on the falling edge of CLK).

7.2.5 Write Protect (WP#) / SIO2

SPI NAND provides Hardware Protection Mode besides the Software Mode. Write Protect (WP#) prevents the block lock bits (BP0, BP1, BP2 and INV, CMP) from being overwritten. If the BRWD bit is set to 1 and WP# is LOW, the block protect bits cannot be altered.

When WP# is driven Low (VIL), during a SET FEATURES command and while the BRWD bit of the Status Register is set to a 1, it is not possible to write to the Status Registers. This prevents any alteration of the Block Protect (BP2, BP1, BP0), INV and CMP bits of the Status Register. As a consequence, all the data bytes in the memory area that are protected by the Block Protect(BP2, BP1,BP0), INV and CMP bits, are also hardware

深圳市满度科技有限公司 Tel:150-1290-5940
Web:www.manduic.com Email:sales@manduic.com

protected against data modification if WP# is Low during a SET FEATURES command. The WP# function is not available when the Quad mode is enabled (QE=1).

The WP# function is replaced by SIO2 for input and output during Quad mode for receiving addresses, and data to be programmed (values are latched on rising edge of the CLK signal) as well as shifting out data (on the falling edge of CLK).

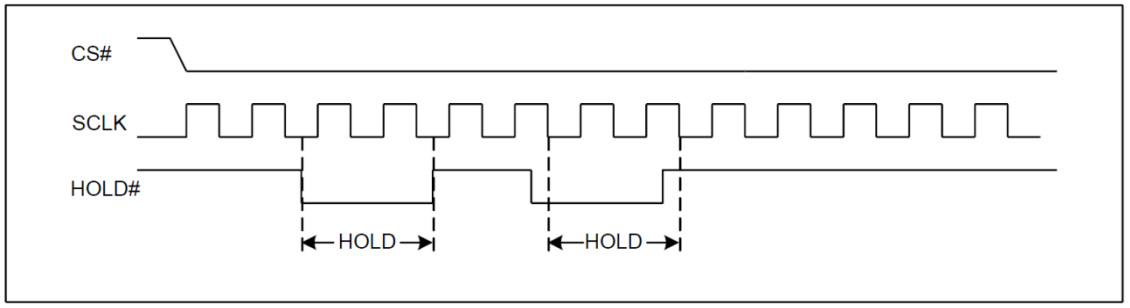

7.2.6 Hold (HOLD#) / SIO3

For Standard SPI and Dual SPI operations, the HOLD# signal allows the device operation to be paused while it is actively selected (when CS# is low). The HOLD# function may be useful in cases where the SPI data and clock signals are shared with other devices. For example, consider if the page buffer was only partially written when a priority interrupt requires use of the SPI bus. In this case the HOLD# function can save the state of the instruction and the data in the buffer so programming can resume where it left off once the bus is available again.

To initiate a HOLD# condition, the device must be selected with CS# low. A HOLD# condition will activate on the falling edge of the HOLD# signal if the CLK signal is already low. If the CLK is not already low the HOLD# condition will activate after the next falling edge of CLK. The HOLD# condition will terminate on the rising edge of the HOLD# signal if the CLK signal is already low. If the CLK is not already low the HOLD# condition will terminate after the next falling edge of CLK. During a HOLD# condition, the Serial Output (SO) is high impedance, and Serial Input (SI) and Serial Clock (CLK) are ignored. The Chip Select (CS#) signal should be kept active (low) for the full duration of the HOLD# operation to avoid resetting the internal logic state of the device.

The HOLD# function is not available when the Quad mode is enabled (QE =1). The Hold function is replaced by SIO3 for input and output during Quad mode for receiving addresses, and data to be programmed (values are latched on rising edge of the CLK signal) as well as shifting out data (on the falling edge of CLK).

Program Load Random Data Quad IO[7]	**72h**	A15-A0[5]	(D7-D0) x4	Next byte	Next byte	Byte N

Notes:

1. The x8 clock = dummy <3:0>, A11-A8
2. The x8 clock = dummy <3:0>, A11-A0
3. The x8 clock = dummy <7:0>, D7-D0
4. The x8 clock = dummy <3:0>, A11-A0,dummy<7:0>,D7-D0
5. The x8 clock = dummy <3:0>, A11-A0,D7-D0,D7-D0
6. MID is Manufacture ID, DID is Device ID
7. Only available in Internal Data Move operation

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

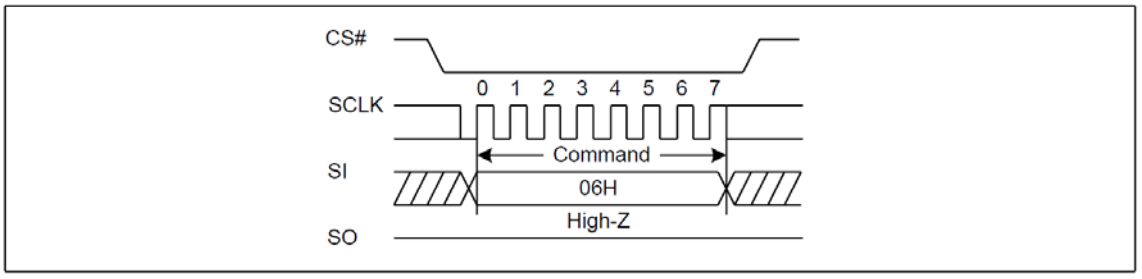

7.4 Write Operations

7.4.1 Write Enable (WREN) (06H)

The Write Enable (WREN) command is for setting the Write Enable Latch (WEL) bit. The Write Enable Latch (WEL) bit must be set prior to following operations that change the contents of the memory array:

- Page Program
- OTP Program
- OTP Protect
- Block Erase

Figure6. Write Enable Sequence Diagram

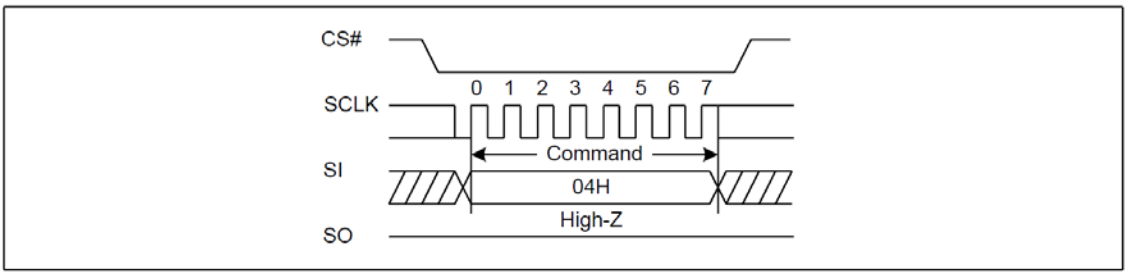

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.4.2 Write Disable (WRDI) (04h)

The Write Disable command is for resetting the Write Enable Latch (WEL) bit. The WEL bit is also reset by following condition:

- Page Program
- OTP Program
- OTP Protect
- Block Erase

Figure7. Write Disable Sequence Diagram

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.5 Feature Operations

7.5.1 Get Features (0FH) and Set Features (1FH)

The Get Features (0Fh) and Set Features (1Fh) commands are used to monitor the device status and alter the device behavior from the default power-on behavior. These commands use a 1-byte feature address to determine which feature is to be read or modified. Features such as OTP and block locking can be enabled or disabled by setting specific bits in feature address A0h and B0h (shown the following table). The status register is mostly read, except WEL, which is writable bit with the WREN (06h) command.

When a feature is set, it remains active until he deice is power cycled or the feature is written to. Unless otherwise specified in the following table, once the device is set, it remains set, even if a Reset (FFh) command is issued.

Table5. Features Settings

Register	Address	Data Bits							
		7	6	5	4	3	2	1	0
Block Lock	A0H	BRWD (R/W)	Reserved	BP2 (R/W)	BP1 (R/W)	BP0 (R/W)	INV (R/W)	CMP (R/W)	Reserved
Feature	B0H	OTP_PRT	OTP_EN (R/W)	Reserved	ECC_EN	CRM	Reserved	HSE (R/W)	QE (R/W)
Status	C0H	ECCS3 (R)	ECCS2 (R)	ECCS1 (R)	ECCS0 (R)	P_FAIL (R)	E_FAIL (R)	WEL (R)	OIP (R)
Drive Strength	D0H	Reserved	DS_IO[1] (R/W)	DS_IO[0] (R/W)	Reserved	Reserved	Reserved	Reserved	Reserved

Note:

1. If BRWD is enabled and WP# is low, then the block lock register (BP2-BP0, INV and CMP) cannot be changed.
2. If QE is enabled, the quad IO operations can be executed.
3. All the reserved bits must be held low when the feature is set.
4. The features in the feature byte B0H are all volatile except OTP_PRT bit.
5. Internal ECC is always on, when ECC_EN is disabled, the ECC status is default value(0000b: ECCS3/ECCS2/ ECCS1/ECCS0) and do not reflect the real ECC status
6. Continuous Read Mode bit, Default CRM=0, Normal read mode, If need Continuous Read function, please contact XTX.
7. (R/W): Read / Write, (R): Read only

Web:www.manduic.com Email:sales@manduic.com

Figure8. Get Features Sequence Diagram

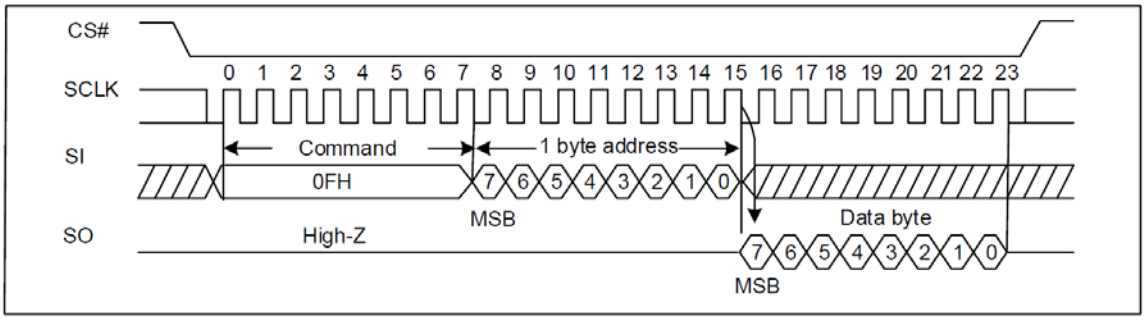

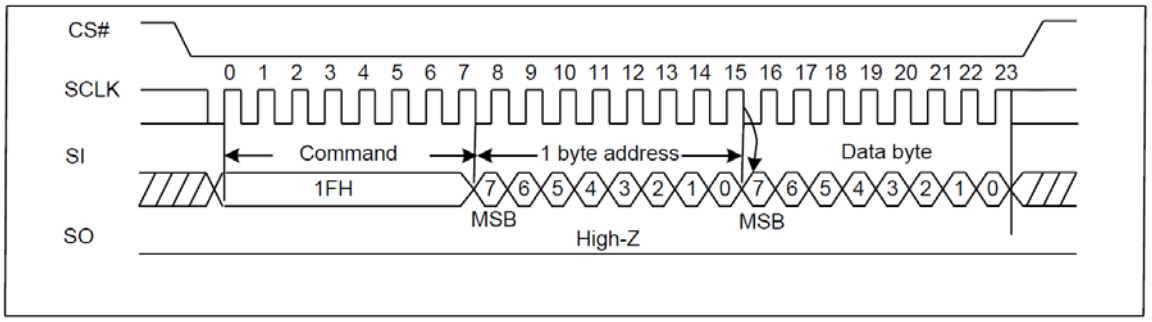

Figure9. Set Features Sequence Diagram

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.6 Read Operations

7.6.1 Page Read

The Page Read (13h) command transfers the data from the NAND Flash array to the cache register. The command sequence is follows:

1. 13h (Page Read To Cache)
2. 0Fh (Get Features command to read the status)
   Monitor whether the status of the operation is finished
3. 0Bh or 03h (Read From Cache)
   Requires mode configure bits, followed by 12-bit column address for the starting byte address
   Other Operation：
   - 3Bh (Read From Cache x2)
   - 6Bh (Read From Cache x4)
   - BBh (Read From Cache Dual IO)
   - EBh (Read From Cache Quad IO)

The Page Read command requires a 24-bit address consisting of 8 dummy bits followed by a 16-bit block/page address. After the block/page addresses are registered, the device starts the transfer from the main array to the cache register, and is busy for tRD time. During this time, the Get Features (0Fh) command can be issued to monitor the status of the operation (refer to the Status Register section). Following a status of successful completion, the Read From Cache (03h/0Bh/3Bh/6Bh/BBh/EBh) command must be issued in order to read the data out of the cache.

The device supports pre-read function. When reading multiple pages continuously, the time will be reduced more than double time.

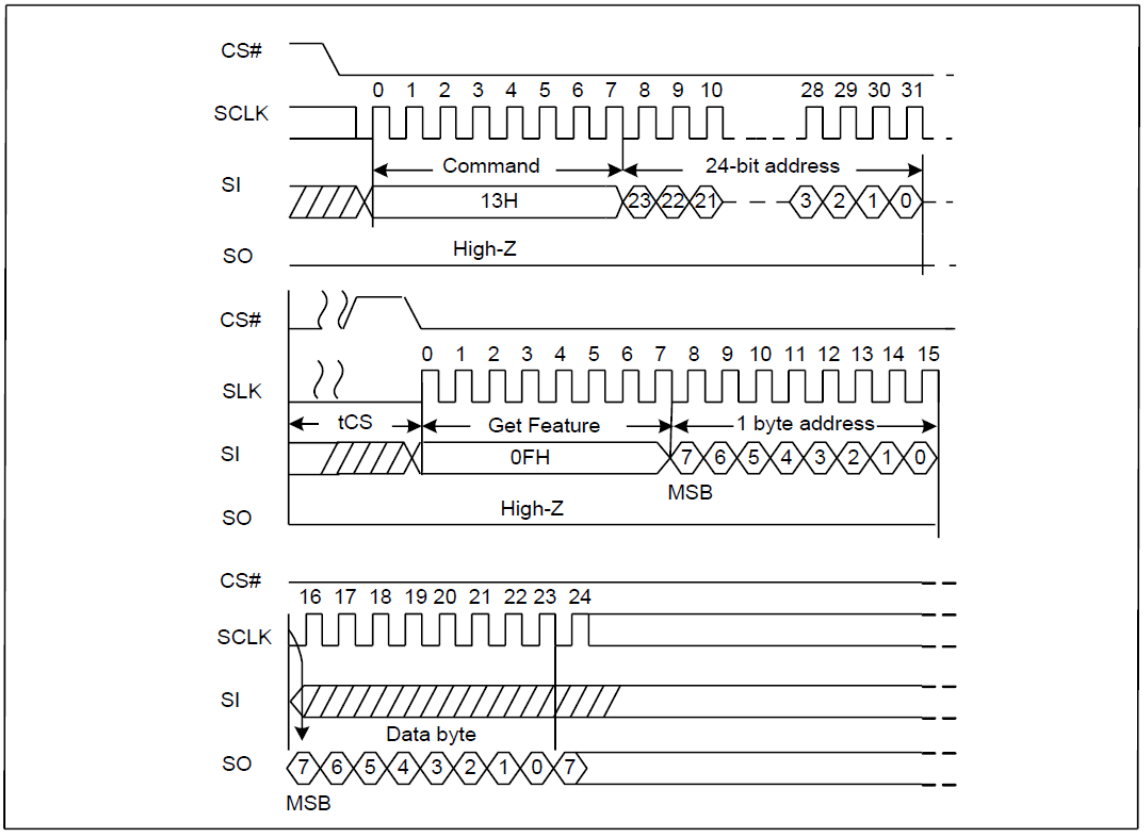

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.6.2 Page Read to Cache (13H)

The Page Read (to buffer) and Next Page Read and Last Page Read command can be used to increase READ operation speed when accessing sequential pages. A normal Page Read (13H+24-bit address) command sequence is issued. The device is busy for tRD time during the time it takes to transfer the first page of data from the memory to the data register. Following a status of successful completion, the Page Read (to buffer) command is latched into the command register. The device is busy while data is being transferred from the data register to the cache register. When the data register contents are transferred to the cache register, another Page Read is automatically started as part of the Page Read (to buffer) command. Data is transferred from the memory array to the data register at the same time data is being output (Random Data Read 03H/0BH/3BH/6BH/BBH/EBH) from the cache register. If the total time to output data exceeds tRD, then the Page Read is hidden. The second and subsequent pages of data are transferred to the cache register by issuing additional Page Read (to buffer) command. This time can vary, depending on whether the previous memory-to-data-register transfer was completed before issuing the next Page Read (to buffer) command. If the data transfer from memory to the data register is not completed before the Page Read (to buffer) command is issued, the device is busy until the transfer is complete. It is not necessary to output a whole page of data before issuing another Page Read (to buffer) command. The device is busy until the previous Page Read is complete and the data has been transferred to the cache register.

To read out the last page of data command is issued. This command transfers data from the data register to the cache register without another Page Read.

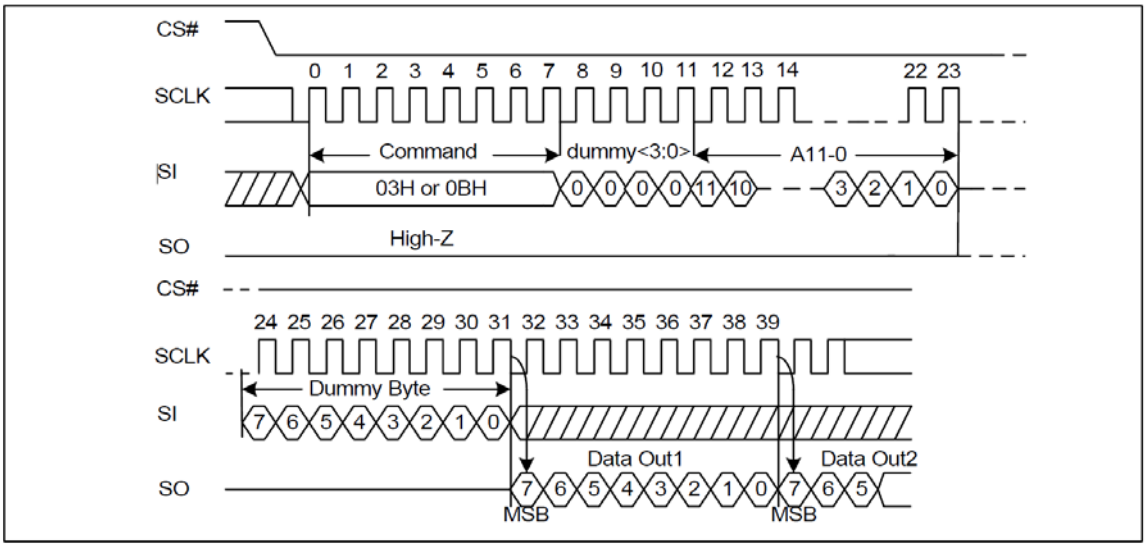

Figure10. Page Read to Cache Sequence Diagram

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

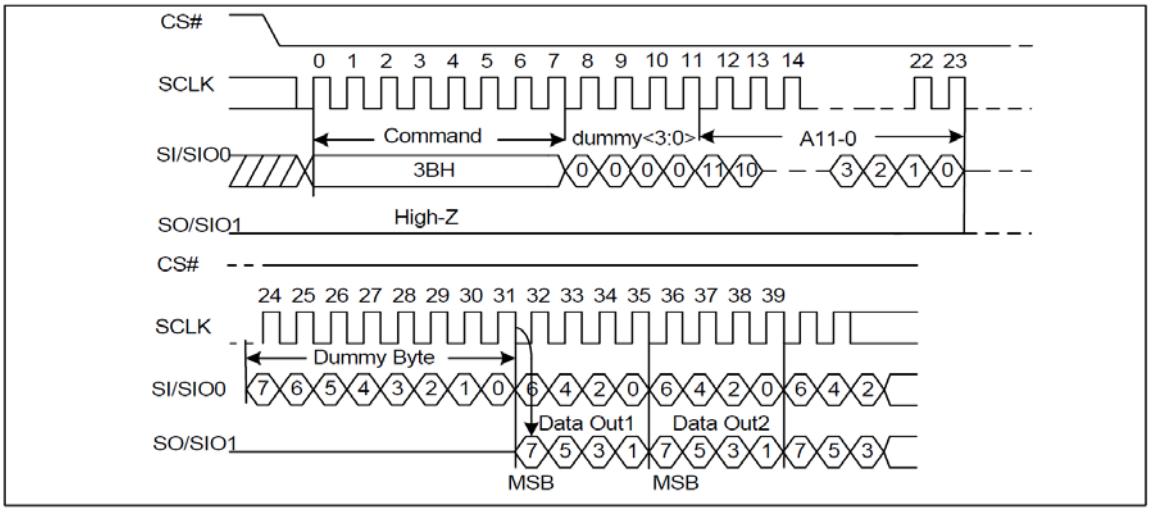

7.6.3 Read From Cache (03H or 0BH)

Figure11. Read From Cache Sequence Diagram

7.6.4 Read From Cache x2 (3BH)

Figure12. Read From Cache x2 Sequence Diagram

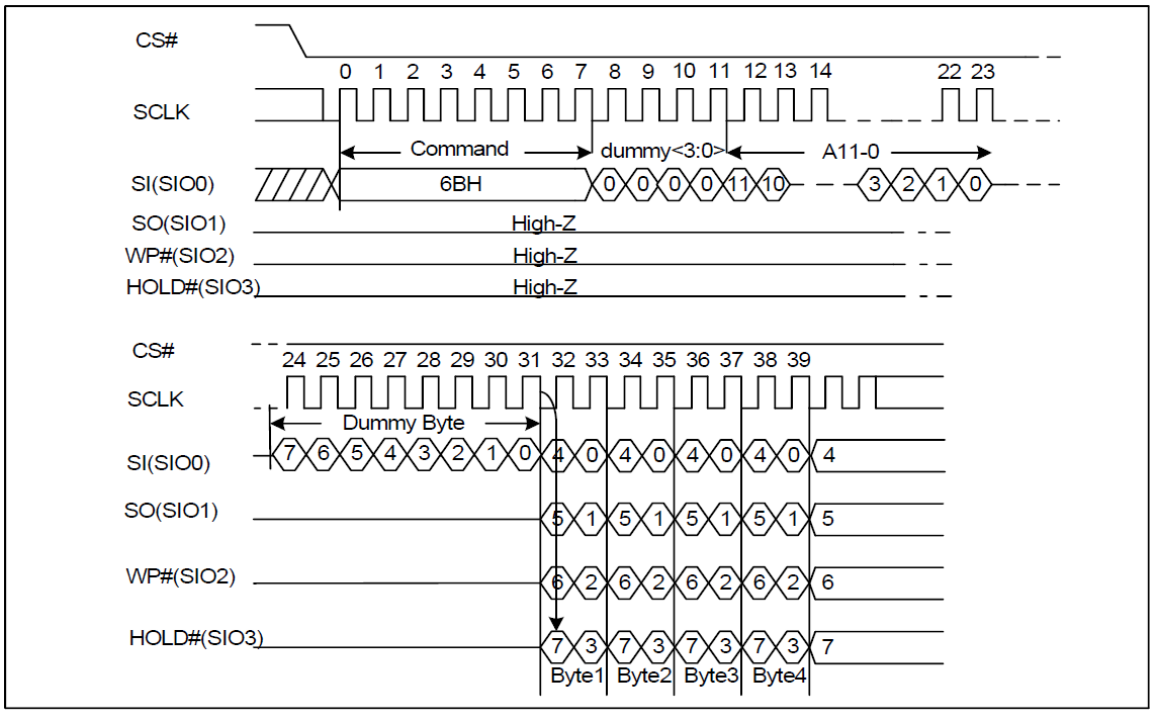

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.6.5 Read From Cache x4 (6BH)

The Quad Enable bit (QE) of feature (B0 [0]) must be set to enable for the read from cache x4 command.

Figure13. Read From Cache x4 Sequence Diagram

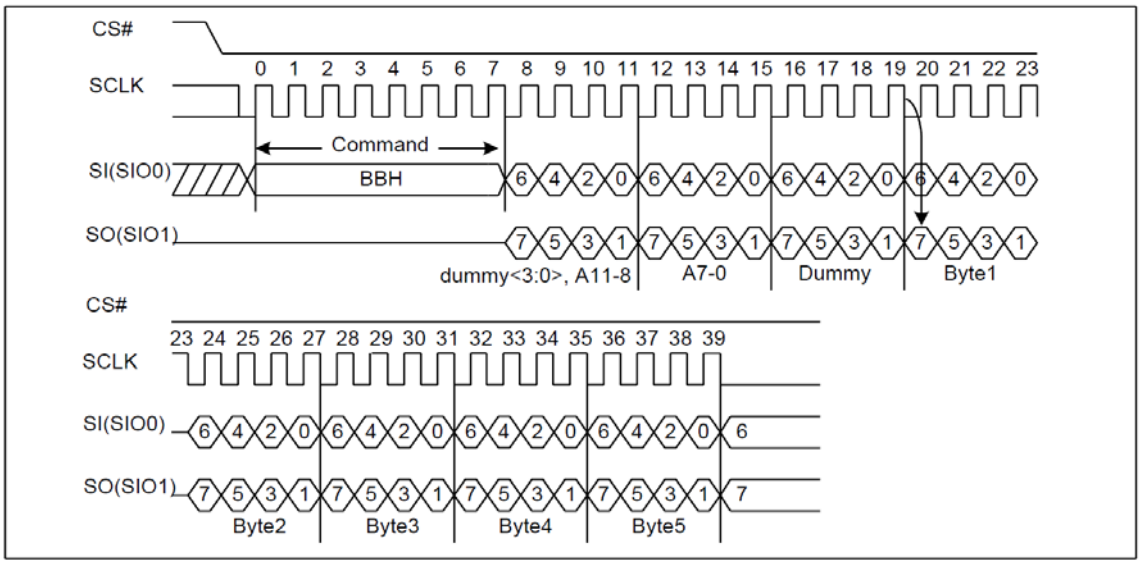

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.6.6 Read From Cache Dual IO (BBH)

The Read from Cache Dual I/O command (BBH) is similar to the Read form Cache x2 command (3BH) but with the capability to input the 4 dummy bits, followed by a 12-bit column address for the starting byte address and a dummy byte by SIO0 and SIO1, each bit being latched in during the rising edge of SCLK, then the cache contents are shifted out 2-bit per clock cycle from SIO0 and SIO1. The first byte addressed can be at any location. The address is automatically incremented to the next higher address after each byte of data is shifted out until the boundary by the dummy<3:0>.

Figure14. Read From Cache Dual IO Sequence Diagram

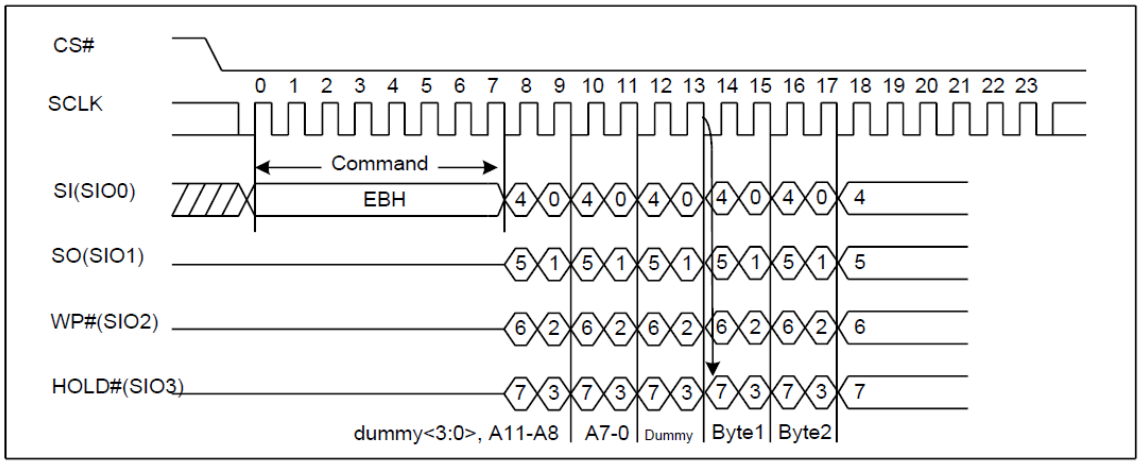

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.6.7 Read From Cache Quad IO (EBH)

The Read from Cache Quad IO command is similar to the Read from Cache x4 command but with the capability to input the 4 dummy bits, followed a 12-bit column address for the starting byte address and a dummy byte by SIO0, SIO1, SIO3, SIO4, each bit being latched in during the rising edge of SCLK, then the cache contents are shifted out 4-bit per clock cycle from SIO0, SIO1, SIO2, SIO3. The first byte addressed can be at any location. The address is automatically incremented to the next higher address after each byte of data is shifted out until the boundary by the dummy<3:0>. The Quad Enable bit (QE) of feature (B0 [0]) must be set to enable for the read from cache quad IO command.

Figure15. Read From Cache Quad IO Sequence Diagram

7.6.8 Page Read Operation (High Speed Mode)

The device has a high speed mode for sequential read operation. When high speed mode is enabled, the average tRD is shortened. The command sequence is the same as the Page Read operation. The users set or clear the HSE bit which enables or disables the high speed mode in the feature table as shown in Table 5. High speed mode is enabled (HSE bit is set to 1) in the default condition. When the users switching the HSE bit, the users have to issue the Set Features command just before the Page Read (13h) command. When the users use the random page read, the recommended setting of the HSE bit is 0 (disable) since tRD becomes longer.

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.6.9 Read ID (9FH)

The Read ID command is used to read the 2 bytes of identifier code programmed into the NAND Flash device. The Read ID command reads a 2-byte table (see below) that includes the Manufacturer ID and the Device ID.

Figure16. Read ID Sequence Diagram

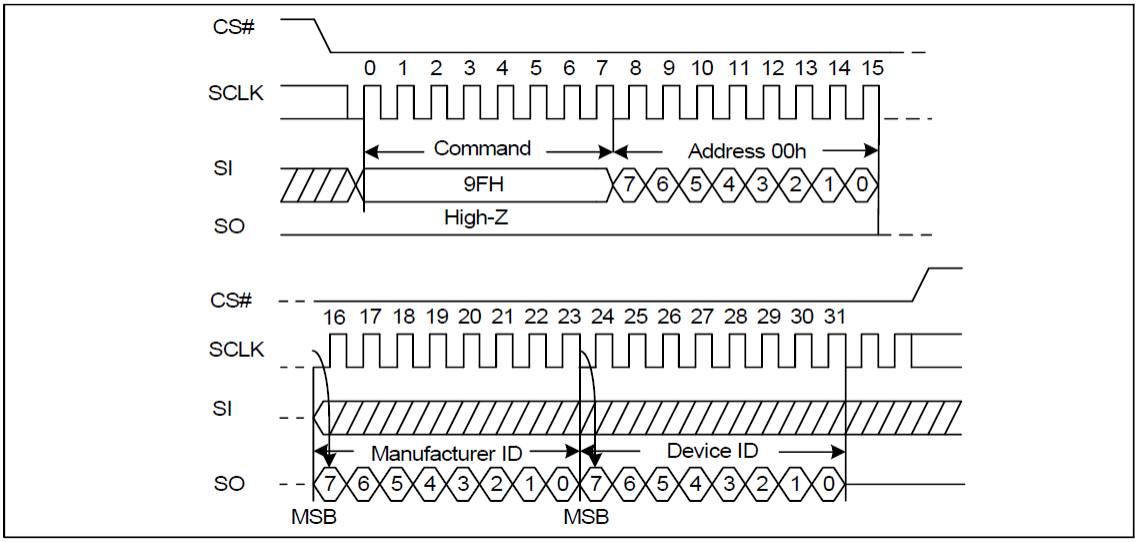

Table6. READ ID Table

Address	Value	Description
Byte 0	0BH	Manufacture ID (XTX)
Byte 1	51H	Device ID (SPI NAND 1.8V 1Gbit)

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.6.10 Read UID

The Read Unique ID function is used to retrieve the 16 byte unique ID (UID) for the device. The unique ID when combined with the device manufacturer shall be unique. The UID data may be stored within the Flash array. To allow the host to determine if the UID is without bit errors, the UID is returned with its complement. If the XOR of the UID and its bit-wise complement is all ones, then the UID is valid. To accommodate robust retrieval of the UID in the case of bit errors, sixteen copies of the UID and the corresponding complement are stored by the target. For example, reading bytes 32-63 returns to the host another copy of the UID and its complement.

Table7. READ UID Table

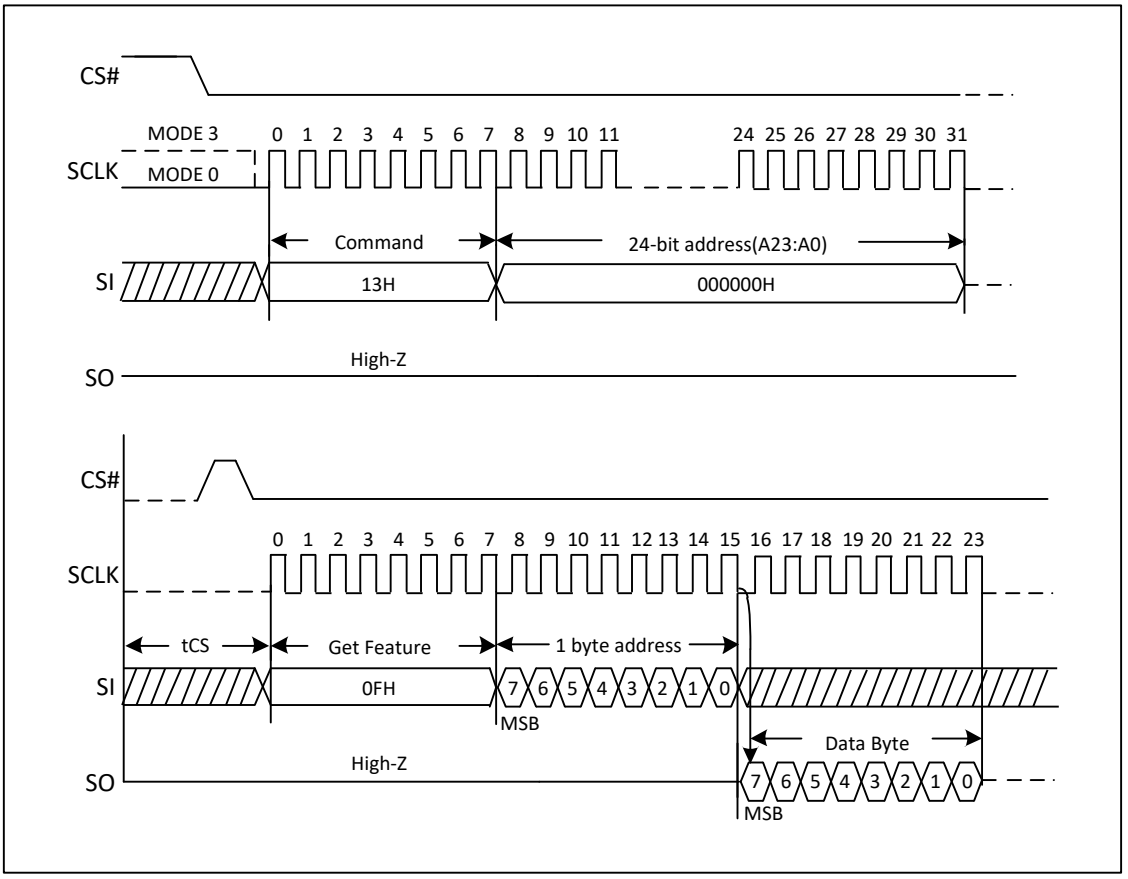

Bytes	Value
0-15	UID
16-31	UID complement (bit-wise)

The following command flow as follows:

1. Use Set Features command (1FH) to set B0 register, to enable OTP_EN.
2. Use Get Features command (0FH) to get data from B0 register and check if the OTP_EN is enable.
3. Use Page Read to cache (13H) command with address 24'h000000h, read data from array to cache.
4. Use 0FH (Get Features command) read the status.
5. User can use Read From Cache command (03H/0BH), read 16 bytes UID from cache.

Figure17. Read UID to cache and Get Feature Command Sequence Diagram

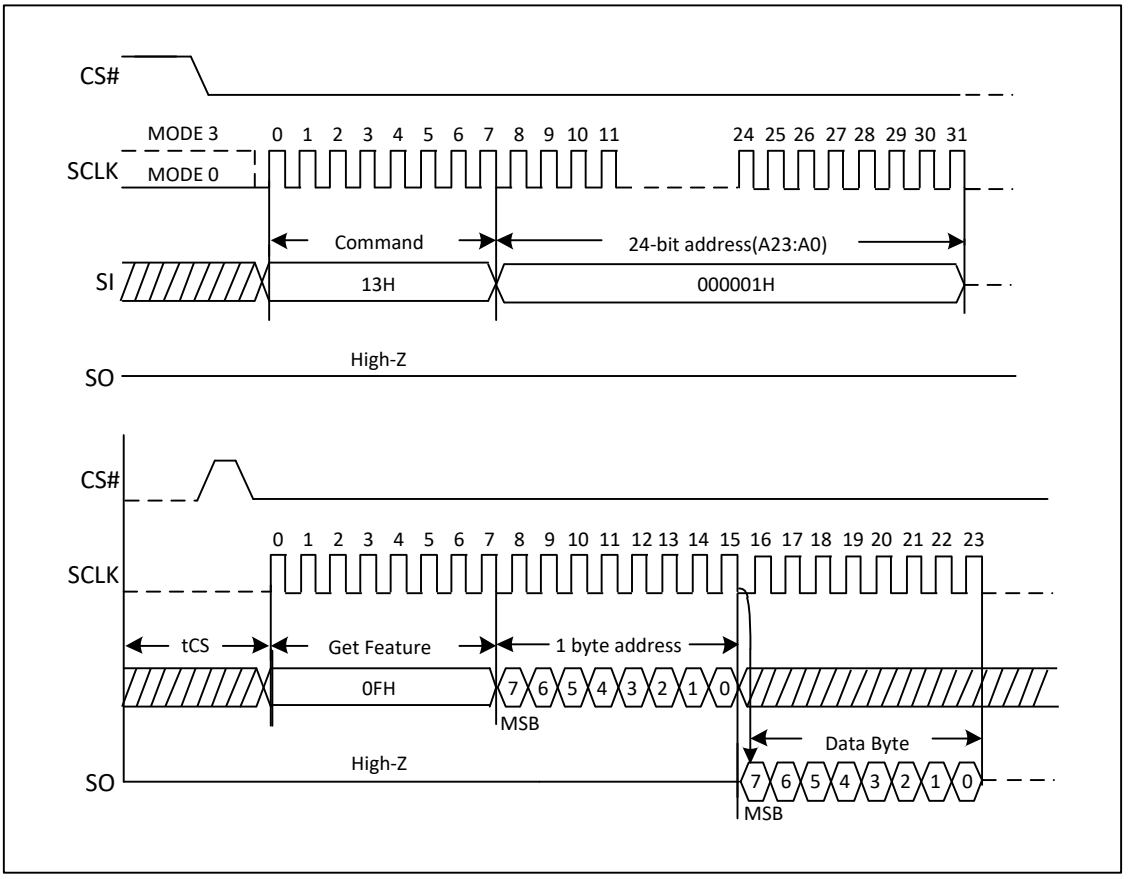

7.6.11 Read Parameter Page

The following command flow must be issued by the memory controller to access the parameter page

1. Issue a Set Features (1FH) command with a feature address of B0H and data value of 40H (OTP enable, ECC disable).
2. Issue a Page Read (13H) command with a block/page address 24'h000001h , and then check the status of the read completion using the Get Features (0FH) command with a feature address of C0H.
3. Issue a Read From Cache (03H) command with an address of 0x00H to read the data out of the NAND device (refer to the following Parameter Page Data Structure table for a description of the contents of the parameter page).
4. To exit reading the parameter page, issue a Set Features (1FH) command with a feature address of B0H and data value of 10H (main array READ, ECC enable).

7.7 Program Operations

7.7.1 Page Program

The Page Program operation sequence programs 1 byte to 2176 bytes of data within a page. The page program sequence is as follows:

- 02H (Program Load)/32H (Program Load x4)
- 06H (Write Enable)
- 10H (Program Execute)
- 0FH (Get Features command to read the status)

The 1st step is to issue a Program Load (02H/32H) command. Program Load consists of an 8-bit Op code, followed by 4 dummy bits and a 12-bit column address, then the data bytes to be programmed. The data bytes are loaded into a cache register which is 2176 bytes long. If more than 2176 bytes are loaded, then those additional bytes are ignored by the cache register. The command sequence ends when CS# goes from LOW to HIGH.

The 2nd step, prior to performing the Program Execute operation, is to issue a Write Enable (06H) command. As with any command that changes the memory contents, the Write Enable must be executed in order to set the WEL bit. If this command is not issued, then the rest of the program sequence is ignored.

The 3rd step is to issue a Program Execute (10h) command to initiate the transfer of data from the cache register to the main array. Program Execute consists of an 8-bit Op code, followed by a 24-bit address (8 dummy bits and a 16-bit page/block address). After the page/block address is registered, the memory device starts the transfer from the cache register to the main array, and is busy for tPROG time.

During this busy time, the status register can be polled to monitor the status of the operation (refer to the Status Register section). When the operation completes successfully, the next series of data can be loaded with the Program Load command.

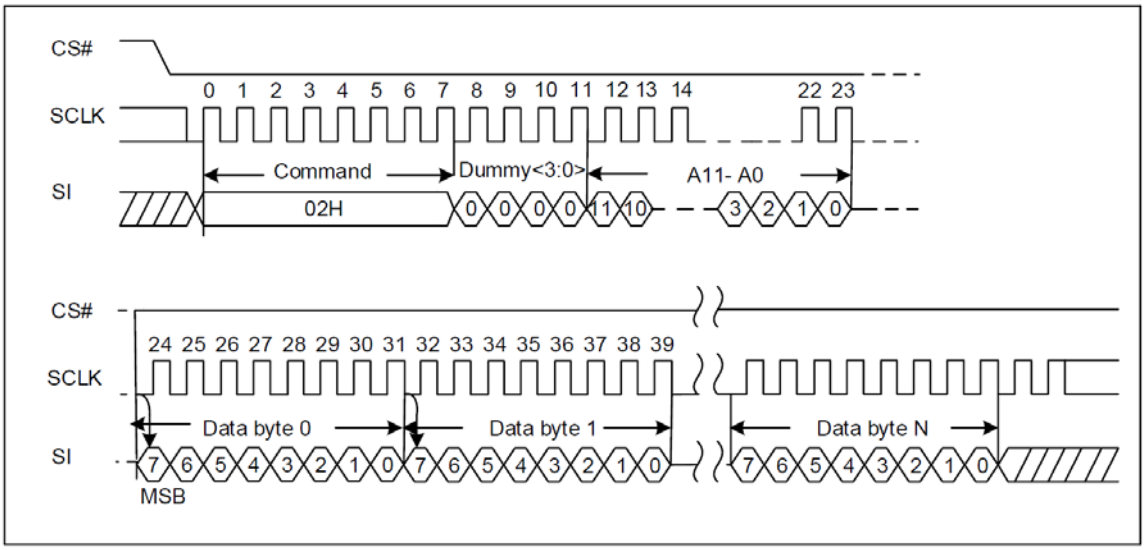

Note :

The number of consecutive partial page programming operations (NOP) within the same page must not exceed 4. In addition, pages must be sequentially programmed within a block.

Web:www.manduic.com Email:sales@manduic.com

7.7.2 Program Load (PL)(02H)

Figure19. Program Load Sequence Diagram

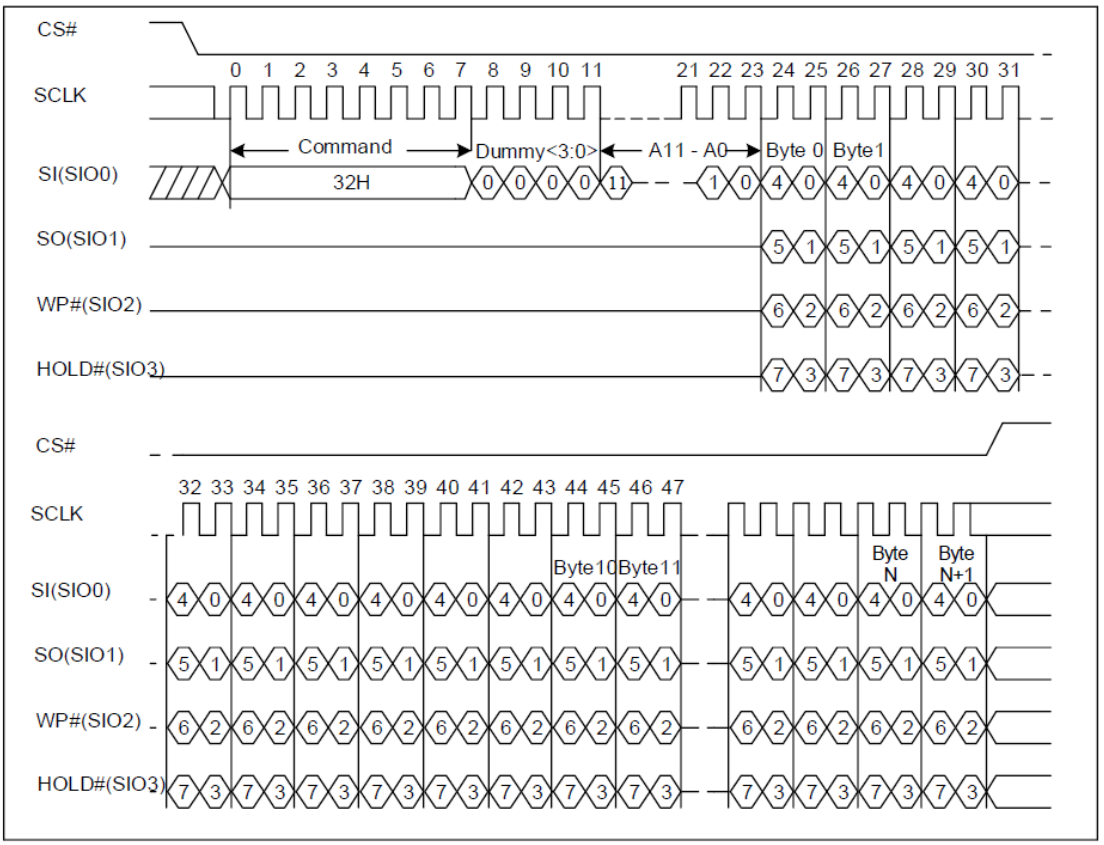

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.7.3 Program Load x4 (PL x4) (32H)

The Program Load x4 command (32H) is similar to the Program Load command (02H) but with the capability to input the data bytes by four pins: SIO0, SIO1, SIO2, and SIO3. The command sequence is shown below. The Quad Enable bit (QE) of feature (B0 [0]) must be set to enable for the Program Load x4 command.

Figure20. Program Load x4 Sequence Diagram

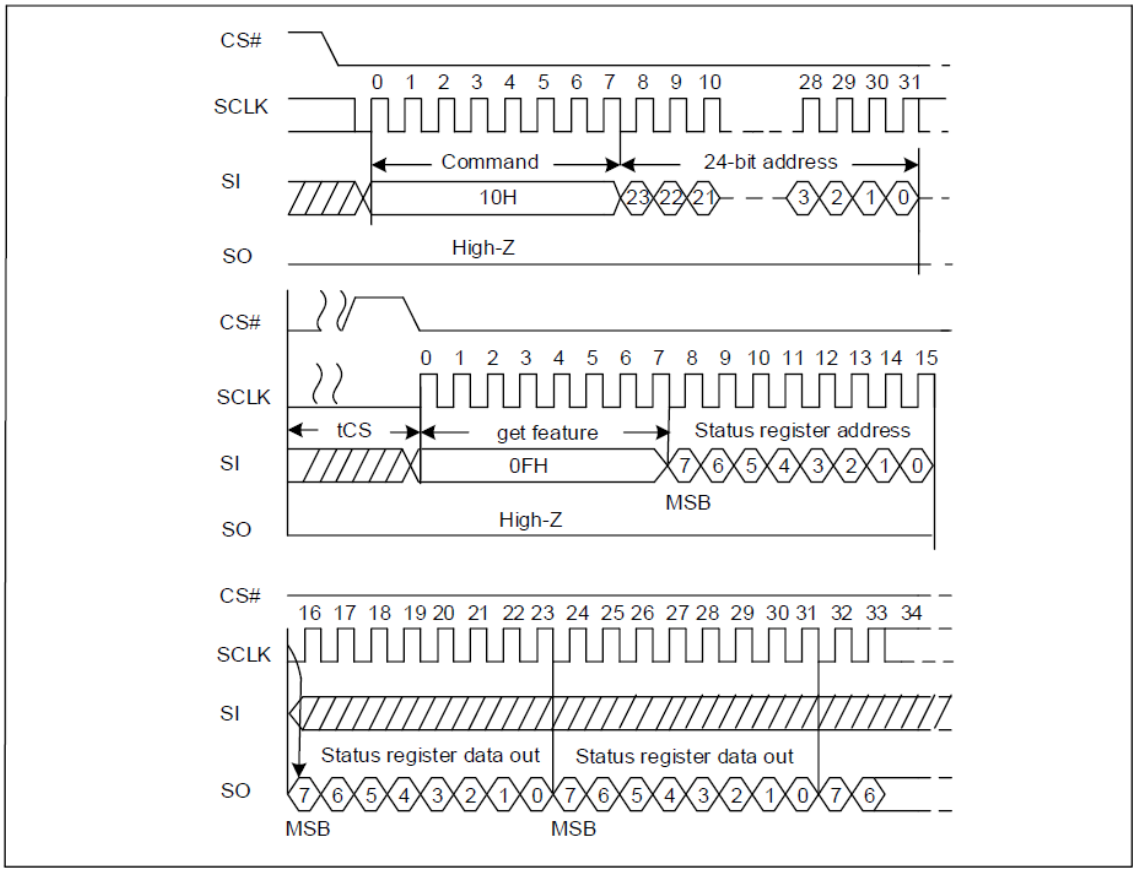

深圳市满度科技有限公司
Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.7.4 Program Execute (PE) (10H)

After the data is loaded, a Program Execute (10H) command must be issued to initiate the transfer of data from the cache register to the main array. Program Execute consists of an 8-bit Op code, followed by a 24-bit address (8 dummy bits and a 16-bit page/block address). After the page/block address is registered, the memory device starts the transfer from the cache register to the main array, and is busy for tPROG time. During this busy time, the status register can be polled to monitor the status of the operation (refer to Status Register). When the operation completes successfully, the next series of data can be loaded with the Program Load command.

Figure21. Program Execute Sequence Diagram

7.7.5 Internal Data Move

The Internal Data Move command sequence programs or replaces data in a page with existing data. The Internal Data Move command sequence is as follows:

- 13H (Page Read to Cache)
- 84H/C4H/ 34H/72H (Program Load Random Data : Optional)
- 06H (Write Enable)
- 10H (Program Execute)
- 0FH (Get Features command to read the status)

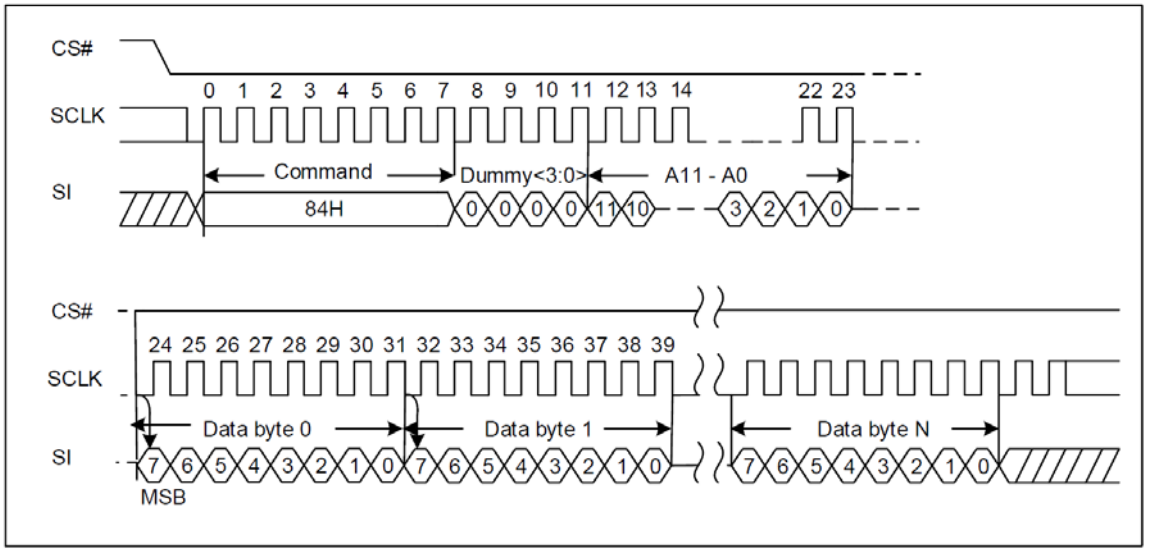

Prior to performing an internal data move operation, the target page content must be read out into the cache register by issuing a Page Read (13H) command. The Program Load Random Data (84H/C4H/34H/72H) command can be issued, if user wants to update bytes of data in the page.

New data is loaded in the 12-bit column address. If the Random Data is not sequential, another Program Load Random Data (84H/C4H/34H/72H) command must be issued with the new column address. After the data is loaded, the Write Enable command must be issued, and then a Program Execute (10H) command can be issued to start the programming operation.

7.7.6 Program Load Random Data (84H)

This command consists of an 8-bit Op code, followed by 4 dummy bits, and a 12-bit column address. New data is loaded in the column address provided with the 12 bits. If the random data is not sequential, then another Program Load Random Data (84H) command must be issued with a new column address. After the data is loaded, a Program Execute (10H) command can be issued to start the programming operation.

Figure22. Program Load Random Data Sequence Diagram

Tel:150-1290-5940
Email:sales@manduic.com

7.7.7 Program Random Data x4 (C4H/34H)

The Program Load Random Data x4 command (C4H/34H) is similar to the Program Load Random Data command (84H) but with the capability to input the data bytes by four pins: SIO0, SIO1, SIO2, and SIO3. The command sequence is shown below. The Quad Enable bit (QE) of feature (B0 [0]) must be set to enable for the Program Load Random Data x4 command.

7.7.8 Program Load Random Data Quad IO (72H)

The Program Load Random Data Quad IO command (72H) is similar to the Program Load Random Data x4 command (C4H/34H) but with the capability to input the 4 dummy bits, and a 12-bit column address by four pins: SIO0, SIO1, SIO2, and SIO3. The command sequence is shown below. The Quad Enable bit (QE) of feature (B0 [0]) must be set to enable for the Program Load Random Data Quad IO command.

Figure24. Program Load Random Data Quad IO Sequence Diagram

Web:www.manduic.com
Tel:150-1290-5940
Email:sales@manduic.com

7.8 Erase Operations

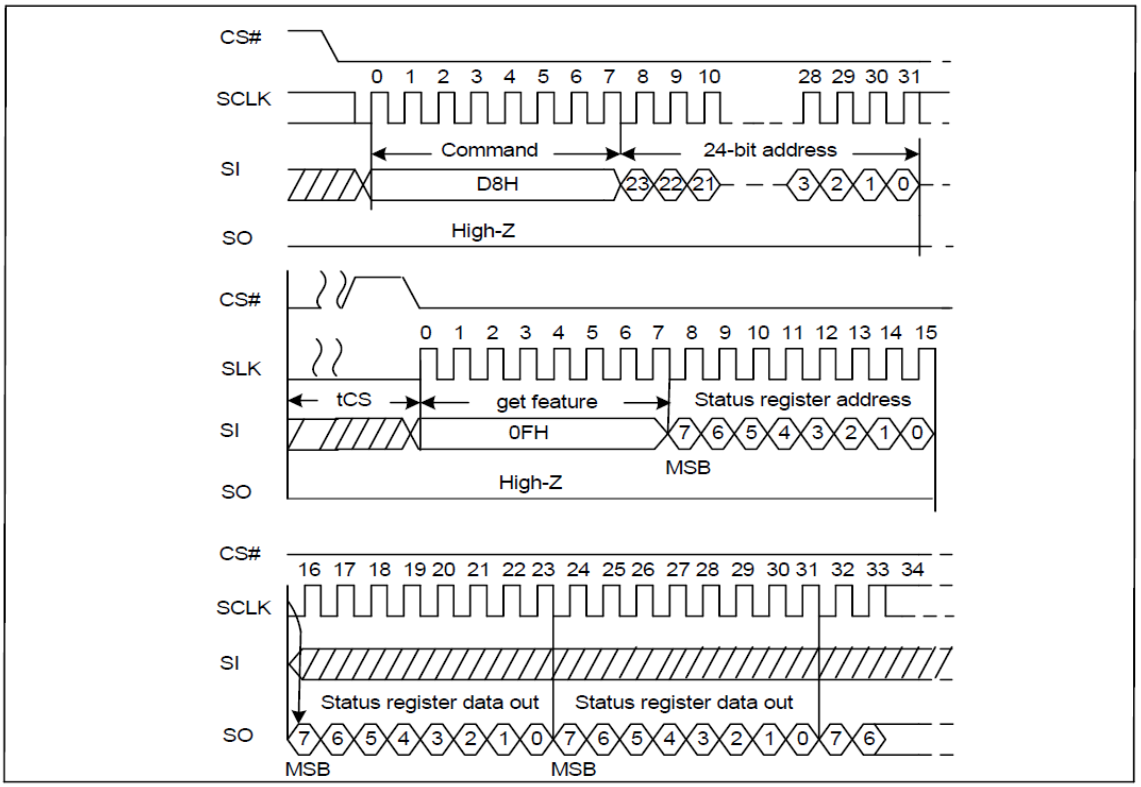

7.8.1 Block Erase (D8H)

The Block Erase (D8H) command is used to erase at the block level. The blocks are organized as 64 pages per block, 2176 bytes per page (2048+128 bytes). Each block is 136Kbytes. The Block Erase command (D8H) operates on one block at a time. The command sequence for the Block Erase operation is as follows:

- 06h (Write Enable command)
- D8h (Block Erase command)
- 0Fh (Get Features command to read the status register)

Prior to performing the Block Erase operation, a Write Enable (06H) command must be issued. As with any command that changes the memory contents, the Write Enable command must be executed in order to set the WEL bit. If the Write Enable command is not issued, then the rest of the erase sequence is ignored. A Write Enable command must be followed by a Block Erase (D8H) command. This command requires a 24-bit address. After the row address is registered, the control logic automatically controls timing and erase-verify operations. The device is busy for tERS time during the Block Erase operation. The Get Features (0FH) command can be used to monitor the status of the operation (refer to the Status Register section).

Figure25. Block Erase Sequence Diagram

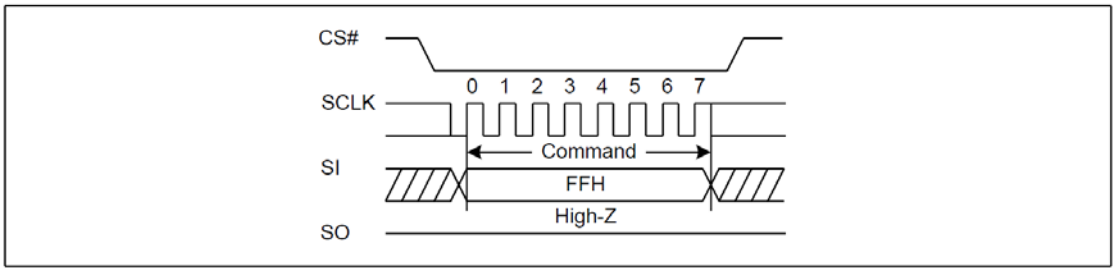

深圳市普度科技有限公司 Tel:+86-13975940
Web:www.manduic.com Email:sales@manduic.com

7.9 Reset Operations

The Reset (FFH) command stops all operations. For example, in case of a program or erase or read operation, the reset command can make the device enter the wait state.

7.9.1 Reset (FFH)

Figure26. Reset (FFH) Sequence Diagram

深圳市普度科技有限公司
Web:www.manduic.com
Tel:150-1200-3940
Email:sales@manduic.com

7.10 Write Protect

The write protection will be determined by the combination of CMP, INV, BP[2:0] bits in the Block Lock Register (A0).

The block lock feature provides the ability to protect the entire device, or ranges of blocks, from the Program and Erase operations. After power-up, the device is in the "locked" state, i.e., feature bits BP0, BP1and BP2are set to 1, INV, CMP and BRWD are set to 0. To unlock all the blocks, or a range of blocks, the Set Features command must be issued to alter the state of protection feature bits. When BRWD is set and WP# is LOW, none of the writable protection feature bits can be set. Also, when a Program/Erase command is issued to a locked block, status bit OIP remains 0.When an Erase command is issued to a locked block, the erase failure, 04H is returned. When a Program command is issued to a locked block, program failure, 08H is returned.

Table8. Block Lock Register Block Protect Bits

CMP	INV	BP2	BP1	BP0	Protected Row Address	Protected Rows
x	x	0	0	0	None	None
0	0	0	0	1	FC00h~FFFFh	Upper 1/64
0	0	0	1	0	F800h~FFFFh	Upper 1/32
0	0	0	1	1	F000h~FFFFh	Upper 1/16
0	0	1	0	0	E000h~FFFFh	Upper 1/8
0	0	1	0	1	C000h~FFFFh	Upper 1/4
0	0	1	1	0	8000h~FFFFh	Upper 1/2
x	x	1	1	1	0000h~FFFFh	All (default)
0	1	0	0	1	0000h~03FFh	Lower 1/64
0	1	0	1	0	0000h~07FFh	Lower 1/32
0	1	0	1	1	0000h~0FFFh	Lower 1/16
0	1	1	0	0	0000h~1FFFh	Lower 1/8
0	1	1	0	1	0000h~3FFFh	Lower 1/4
0	1	1	1	0	0000h~7FFFh	Lower 1/2
1	0	0	0	1	0000h~FBFFh	Lower 63/64
1	0	0	1	0	0000h~F7FFh	Lower 31/32
1	0	0	1	1	0000h~EFFFh	Lower 15/16
1	0	1	0	0	0000h~DFFFh	Lower 7/8
1	0	1	0	1	0000h~BFFFh	Lower 3/4
1	0	1	1	0	0000h~003Fh	Block0
1	1	0	0	1	0400h~FFFFh	Upper 63/64
1	1	0	1	0	0800h~FFFFh	Upper 31/32
1	1	0	1	1	1000h~FFFFh	Upper 15/16
1	1	1	0	0	2000h~FFFFh	Upper 7/8
1	1	1	0	1	4000h~FFFFh	Upper 3/4
1	1	1	1	0	0000h~003Fh	Block0

When WP# is not LOW, user can issue bellows commands to alter the protection states as want.

- Issue Set Features register write(1FH)
- Issue the feature bit address(A0H) and the feature bits combination as the table

深圳市普度科技有限公司 Tel:150-1200-3940
Web:www.manduic.com Email:sales@manduic.com

8. Status Register

The device has an 8-bit status register that software can read during the device operation for operation state query. The status register can be read by issuing the Get Features (0FH) command, followed by the feature address C0h(see Feature Operation).The Output Driver Register can be set and read by issuing the Set Features(1FH)and Get Features command followed by the feature address D0h(see Feature Operation).

Table9. Status Register Bit Description

Bit	Bit Name	Description
ECCS3,ECCS2, ECCS1,ECCS0	ECC Status	ECCS3/ECCS2/ECCS1/ECCS0 provides ECC Status as follows: XX00b= No bit errors were detected during the previous read algorithm. 0001b= Bit errors(≤4) were detected and corrected. 0101b= Bit errors(=5) were detected and corrected. 1001b= Bit errors(=6) were detected and corrected. 1101b= Bit errors(=7) were detected and corrected. XX10b= Bit errors greater than ECC capability(8 bits) and not corrected XX11b= Bit errors reach ECC capability(8 bits) and corrected Bit errors cannot be detected and corrected if their number exceeds the tolerance. Therefore, block data should be refreshed when ECC status is equal to XX10b. ECCS is set to 0000b either following a Reset, or at the beginning of the Read. It is then updated after the device completes a valid Read operation. After power-on Reset, ECC status is set to reflect the contents of block 0, page 0.
P_FAIL	Program Fail	This bit indicates that a program failure has occurred (P_FAIL set to 1). It will also be set if the user attempts to program an invalid address or a protected region, including the OTP area. This bit is cleared during the Program Execute command sequence or a Reset command (P_FAIL = 0).
E_FAIL	Erase Fail	This bit indicates that an erase failure has occurred (E_FAIL set to 1). It will also be set if the user attempts to erase a locked region. This bit is cleared (E_FAIL = 0) at the start of the Block Erase command sequence or the Reset command.
WEL	WRITE ENABLE Latch	This bit indicates the current status of the Write Enable Latch (WEL) and must be set (WEL=1), prior to issuing a Program Execute or Block Erase command. It is set by issuing the Write Enable command. WEL can also be disabled (WEL= 0), by issuing the Write Disable command.
OIP	Operation In Progress	This bit is set (OIP = 1) when a Program Execute, Page Read, Block Erase, or Reset command is executing, indicating the device is busy. When the bit is 0, the interface is in the ready state.

深圳市普度科技有限公司 Tel:150-1200-5940
Web:www.manduic.com Email:sales@manduic.com

ECCS1	ECCS0	ECCS3	ECCS2	Description
0	0	X	X	No bit errors were detected during the previous read algorithm.
0	1	0	0	Bit errors(≤4) were detected and corrected.
0	1	0	1	Bit errors(=5) were detected and corrected.
0	1	1	0	Bit errors(=6) were detected and corrected.
0	1	1	1	Bit errors(=7) were detected and corrected.
1	0	X	X	Bit errors greater than ECC capability(8 bits) and not corrected
1	1	X	X	Bit errors reach ECC capability(8 bits) and corrected

Web:www.manduic.com
Tel:150-1200-5940
Email:sales@manduic.com

9. OTP Region

The device offers a protected, One-Time Programmable NAND Flash memory area. Four full pages (2176 bytes per page) are available on the device, and the entire range is guaranteed to be good. Customers can use the OTP area any way they want, like programming serial numbers, or other data, for permanent storage. When delivered from factory, feature bit OTP_PRT is 0.

To access the OTP feature, the user must issue the Set Features command, followed by feature address B0h. When the OTP is ready for access, pages 02h–05h can be programmed in sequential order. The Program Load (02H) and Program Execute (10H) commands can be used to program the pages. Also, the Page Read (13H) command and Read From Cache (03H/0BH/3BH/6BH/BBH/EBH) commands can be used to read the OTP area. The data bits used in feature address B0h to enable OTP access are shown in the table below.

9.1 OTP Access

To access OTP, perform the following command sequence:

- Issue the Set Features command (1Fh)
- Set feature bit OTP_EN
- Issue the Page Program (if OTP_EN=1) or Page Read command

It is important to note that after bits 6 and 7 of the OTP register are set by the user, the OTP area becomes read-only and no further programming is supported. For OTP states, see the following table.

9.2 OTP Protect

- Issue the Set Features command (1FH)
- Set feature bit OTP_EN and OTP_PRT
- 06H (Write Enable)
- Issue the Program Execute (10H) command.

Table10.OTP States

OTP_PRT	OTP_EN	State
x	0	Normal Operation
0	1	Access OTP region
1	1	1. When the device power on state OTP_PRT is 0, user can set feature bit OTP_PRT and OTP_EN to 1, then issue Program Execute (10H) to lock OTP, and after that OTP_PRT will permanently remain 1. 2. When the device power on state OTP_PRT is 1, user can only read the OTP region data.

深圳市普度科技有限公司 Tel:150-1200-5940
Web:www.manduic.com Email:sales@manduic.com

10. Error Management

This NAND Flash device is specified to have the minimum number of valid blocks (NVB) of the total available blocks per die shown in the table below. This means the devices may have blocks that are invalid when shipped from the factory. An invalid block is one that contains at least one page that has more bad bits than can be corrected by the minimum required ECC. Additional bad blocks may develop with use. However, the total number of available blocks will not fall below NVB during the endurance life of the product.

Although NAND Flash memory devices may contain bad blocks, they can be used reliably in systems that provide bad-block management and error-correction algorithms. This ensures data integrity.

Internal circuitry isolates each block from other blocks, so the presence of a bad block does not affect the operation of the rest of the NAND Flash array.

NAND Flash devices are shipped from the factory erased. The factory identifies invalid blocks before shipping by programming the Bad Block Mark (00h) to the first spare area location in each bad block. This method is compliant with ONFI Factory Defect Mapping requirements. See the following table for the bad-block mark.

System software should initially check the first spare area location for non-FFh data on the first page of each block prior to performing any program or erase operations on the NAND Flash device. A bad-block table can then be created, enabling system software to map around these areas. Factory testing is performed under worst-case conditions. Because invalid blocks may be marginal, it may not be possible to recover the bad-block marking if the block is erased.

Table11.Error Management Details

Description	Requirement
Minimum number of valid blocks (NVB)	1004
Total available blocks per die	1024
First spare area location	Byte 2048
Bad-block mark	Non FFh

深圳市满度科技有限公司 Tel:15221290-5940
Web:www.manduic.com Email:sales@manduic.com

11. ECC Protection

The device offers data corruption protection by offering optional internal ECC. ECC is always on after device power up, so the default Read and Program commands operate with internal ECC in the “active” state.

During a Program operation, the device calculates an ECC code on the 2k page in the cache register, before the page is written to the NAND Flash array.

During a Read operation, the page data is read from the array to the cache register, where the ECC code is calculated and compared with the ECC code value read from the array. If error bits are detected, the error is corrected in the cache register. Only corrected data is output on the I/O bus. The ECC status bit indicates whether or not the error correction was successful. The ECC Protection table below shows the ECC protection scheme used throughout a page.

With internal ECC, the user must accommodate the following:

- Spare area definitions provided in the ECC Protection table below.
- ECC can protect according main and spare areas. WRITEs to the ECC area are ignored.

Table12.ECC Protection and Spare Area

Min Byte Address	Max Byte Address	ECC Protected	Number Of Bytes	Area	Description
000H	1FFH	Yes	512	Main 0	User data 0
200H	3FFH	Yes	512	Main 1	User data 1
400H	5FFH	Yes	512	Main 2	User data 2
600H	7FFH	Yes	512	Main 3	User data 3
800H	80FH	Yes	16	Spare 0	User meta data 0
810H	81FH	Yes	16	Spare 1	User meta data 1
820H	82FH	Yes	16	Spare 2	User meta data 2
830H	83FH	Yes	16	Spare 3	User meta data 3
840H	87FH	Yes	64	Spare 4	Internal ECC parity data

12. Electrical Characteristics

12.1 Absolute Maximum Ratings

Operating Temperature	-40°C to +85°C
Storage Temperature	-65°C to +150°C
Voltage on I/O Pin with Respect to Ground	-0.3V to VCC+0.3V (<= 2.25V)
V_{CC}	-0.3V to 2.25V

***NOTICE:**

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

12.2 Pin Capacitance

Applicable over recommended operating range from: T_A = 25°C, f = 1 MHz.

Symbol	Test Condition	Max	Units	Conditions
C_{IN}	Input Capacitance	6	pF	VIN = 0V
C_{OUT} (1)	Output Capacitance	8	pF	VOUT = 0V

Note:

Characterized and is not 100% tested.

12.3 Power-on and Power-off Timing

Do not turn off the power before write/erase operation is complete. Avoid using the device when the battery is low. Power shortage and/or power failure before write/erase operation is complete will cause loss of data and/or damage to data.

Figure27. Power-On Timing

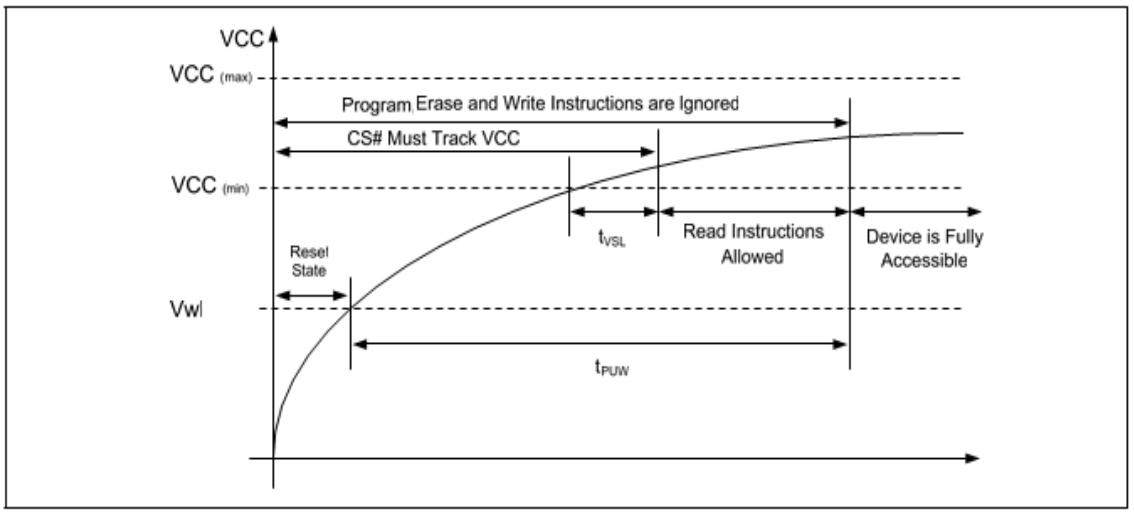

Table13.Power-On Timing and Write Inhibit Threshold

PARAMETER	SYMBOL	SPEC		UNIT
		MIN	MAX	
VCC (min) to CS# Low	t_{VSL}	1.5		ms
Time Delay Before Write Instruction	t_{PUW}	6		ms
Write Inhibit Voltage	V_{WI}		1.4	V

12.4 DC Electrical Characteristics

Table14.DC Characteristics

Applicable over recommended operating range from: TA =-40°C to 85°C, VCC = 1.7V to 1.95 V, (unless otherwise noted)

SYMBOL	PARAMETER	CONDITIONS	SPEC			UNIT
			MIN	TYP	MAX	
VCC	Supply Voltage		1.7		1.95	V
ILI	Input Leakage Current Times				±2	µA
ILO	Output Leakage Current				±2	µA
ICC1	Standby Current	VCC=1.95V, CS# = VCC, VIN = VSS or VCC		15	100	µA
ICC	Read Current	CLK=0.1VCC/0.9VCC FCLK=108MHz		26	40	mA
	Program Current			28	40	mA
	Erase Current			18	26	mA
VIL (1)	Input Low Voltage		-0.3		0.2VCC	V
VIH (1)	Input High Voltage		0.8VCC		VCC+0.3	V
VOL	Output Low Voltage	IOL = 1.6mA			0.4	V
VOH	Output High Voltage	IOH = -100 µA	VCC-0.2			V

Note:

VIL min and VIH max are reference only and are not tested.

12.5 AC Measurement Conditions

Table15.AC Measurement Conditions

SYMBOL	PARAMETER	SPEC		UNIT
		MIN	MAX	
CL	Load Capacitance		30	pF
TR, TF	Input Rise and Fall Times		5	ns
VIN	Input Pulse Voltages	0.2 V_{CC} to 0.8 V_{CC}		V
IN	Input Timing Reference Voltages	0.3 V_{CC} to 0.7 V_{CC}		V
OUT	Output Timing Reference Voltages	0.5V_{CC}		V

12.6 AC Electrical Characteristics

Table16.AC Characteristics

Applicable over recommended operating range from: TA = -40°C to 85°C, VCC = 1.7V to 1.95V

SYMBOL	PARAMETER	SPEC			UNIT
		MIN	TYP	MAX	
FC	Serial Clock Frequency for: all command			108	MHz
tCH(1)	Serial Clock High Time	3			ns
tCL(1)	Serial Clock Low Time	3			ns
tCLCH	Serial Clock Rise Time (Slew Rate)	0.1			V/ns
tCHCL	Serial Clock Fall Time (Slew Rate)	0.1			V/ns
tSLCH	CS# Active Setup Time	7.5			ns
tCHSH	CS# Active Hold Time	2.5			ns
tSHCH	CS# Not Active Setup Time	2.5			ns
tCHSL	CS# Not Active Hold Time	2.5			ns
tSHSL/tCS	CS# High Time	100			ns
tSHQZ	Output Disable Time			10	ns
tCLQX	Output Hold Time(CL=30pF)	2			ns
tCLQV	Clock Low to Output Valid(CL=30pF)			8	ns
tDVCH	Data In Setup Time	2			ns
tCHDX	Data In Hold Time	1.75			ns
tHLCH	HOLD# Low Setup Time (relative to CLK)	3.375			ns
tHHCH	HOLD# High Setup Time (relative to CLK)	3.375			ns
tCHHH	HOLD# Low Hold Time (relative to CLK)	2.5			ns
tCHHL	HOLD# High Hold Time (relative to CLK)	2.5			ns
tHLQZ	HOLD# Low to High-Z Output			6	ns
tHHQX	HOLD# High to Low-Z Output			6	ns
tWHSL	WP# Setup Time before CS# Low	20			ns
tSHWL	WP# Hold Time after CS# High	100			ns

Note:

tCH + tCL >= 1 / FC ; characterized and not 100% tested.

16. Revision History

Version No	Description	Date
0.1	Preliminary Spec	October-20-2020
0.2	Update status register description and package information	April-27-2021
0.3	Update ECC status and spare area layout for 14bit ECC	May-18-2021
0.4	Update Read Parameter Page and UID function. Update ECC Status and spare area layout for 8bit ECC. Update the AC/DC parameter.	Dec-13-2021
0.5	Update the typical value of Standby Current from 20uA to 15uA. Update the typical /maximum value of Read current and Page Program current . Update the value of tSLCH、tSHQZ、tCLQV、tRD、tPROG、tVSL.	Dec-16-2021
